Check -Tyfide is also known as chicken-skin-skin-skin-skin-to-tyfyvirus (VZV) which is a highly-resistant disease. The disease usually affects children under 10 years of age. The check is usually not serious in healthy children, who usually recover mostly without complications. However, the disease can also attack adults, where symptoms may appear heavier than those of children. Common symptoms of the symptoms include fever, sore ness on the body, hunger and fatigue. The first appears on the stomach, back and face and can spread throughout the body. The silk will turn into a red color filled with a dry, then dry, a co-sour, and sprinkle for 7 to 14 days. A person with a schitoccan can spread the virus before he has any symptoms. The condition is most easily spread over 2 to 3 days until the chickpeas are completely dry and closed. The development of the disease takes 10-21 days after the exposure. The virus is primarily spread by touching or receiving a sneeze from the circulatory viral particles, and possibly by the small snout from an infected person who enters the air by those who breathe or speak, coughing or sneezing, for example. Treatment for anxiety, that can reduce the risk of under-management and complications, reducing symptoms such as fever-lowering drugs (paracetamol), as well as the immune system can be added to help with the healing process. As home care, it can be accompanied by a lot of drinking to prevent water shortage and nutritional deficiencies, Can not for waterpon (to reduce the skin, apply the loins, kalamín powder and should be hunted to keep the bath as usual, because the germs that are related to the sedative. However, the symptoms will be mixed with less red scum or scurvy, no fever, and will heal rapidly. Later in life, the virus is likely to emerge and shanghai or often known as Shanghai, this viral infection is especially so. A deficiency occurs in adults and people with immune systems.
